Castle Nut Upgrade (Beginning Feb. 2009)

**6 Position
Castle Nut**
TDE #10665

**12 Position
Castle Nut**
TDE #10634

The new 12 position castle nut allows a finer bearing adjustment by having twice the number of positions compared to the older 6 position castle nut. 12 slots make it easier and faster to find the correct position for proper end play. Also changed is the return to the standard flat washer and cotter pin. Both items are easier for consumers to find through conventional retail outlets than the “D” washer and “tang” washers used in the 6 position version. The offset Super Lube zerk is easily accessible when the Super Lube rubber plug is removed from the cap.
